## Engineering Specifications for Innovative Systems Adjustable Upright

Adjustable Uprights are designed to hold a maximum load of 50 lbs between upright, evenly distributed over the 10 foot width crossbar (Telescopic Drape Support). The Adjustable Upright must not be extended beyond the label "Do Not Raise Beyond This Level".

The Recommended Base Plate for Various Adjustable Uprights is listed below. It is always good practice to add additional weight (ie: Sand Bags or weights) on top of the Bases Plates. Especially if heavier drape is used or if traffic is moving about the uprights. One should be particularly careful not to open any large doors in the facility allowing wind force to be applied to your back wall. This can cause the back wall (Uprights) to be blown over.

ADJUSTABLE UPRIGHTS
